Software Engineering Student & Applied AI Intern at SNCF

Engineering student with strong foundations in **distributed systems, software design, and scalable backend architecture**. Experienced in building production-ready full-stack applications and AI-driven systems.

Programming : Python, JavaScript/TypeScript, Java, C/C++, SQL/NoSQL, Rust
Backend & Systems: FastAPI, Next.js, Node.js, Spring Boot, REST APIs, WebSockets
Databases: MySQL, MongoDB, Firebase, Redis
Cloud & DevOps: Docker, Google Cloud Platform, Terraform, Cloud Tasks, Scheduler
AI & Agentic Systems: ADK, LangGraph/LangChain, Natural Language Processing, LLM, RAG
Interests: Football player at ICC Football

Education

POLYTECH UNIVERSITY OF TOURS

Tours, France

Engineering Degree in Computer Science (BAC+4)

Expected graduation: September 2027

Relevant Coursework: Data Structures & Algorithms, Software engineering, Distributed and parallel systems

HIGH SCHOOL OF MANAGEMENT, INFORMATICS AND TELECOMMUNICATION

Morocco

Bachelor's Degree in Computer Systems Engineering

2021 – 2024

Work experience

Applied AI Intern

April 2026 – August 2026

SNCF Voyageurs

Saint-Denis, France

- Designing and implementing PDF extraction pipelines for complex S1000D-structured railway maintenance documentation spanning 1000+ of technical manual pages.
- Developing semantic matching workflows using NLP techniques, RapidFuzz, and sentence-transformers to identify redundant or semantically related maintenance procedures.
- Prototyping an LLM-assisted harmonization system to compare and reconcile conflicting maintenance instructions across document versions, aiming to reduce manual harmonization effort for engineering teams.

Projects

CareFlow | AI-Driven Clinical Follow-Up System

Production-oriented multi-agent system conducting automated post-discharge follow-up calls, designed to reduce hospital readmissions by 30% and address a systemic healthcare issue costing over \$26B annually.

- Designed a modular multi-agent architecture coordinating real-time outbound voice calls via Twilio and dynamic speech synthesis using ElevenLabs.
- Balanced latency and reasoning trade-offs through asynchronous task orchestration and clear separation of agent responsibilities.

Technologies: Python, Next.js, ADK, LangGraph, Twilio, ElevenLabs, Cloud Tasks, Firestore

Useful link: [Get more details on careflow here !](#)

MockInterview.ai | Real-Time Multimodal AI Interview Platform

Production-oriented multimodal platform simulating live technical interviews through low-latency voice, screen-streaming, and AI-driven coding interactions.

- Architected a real-time interview system using FastAPI and WebSockets to stream bidirectional audio and screen context with low-latency multimodal AI interactions.
- **Built personalized interview orchestration pipelines integrating RAG-based CV/job-description grounding, dynamic AI personas, and live coding/system design environments.**
- Designed production-ready cloud infrastructure using Docker, Terraform, Google Cloud Run, Cloud Storage, and OpenTelemetry-based observability pipelines.

Technologies: FastAPI, React, ADK, Gemini Live API, File Search Tool, WebSockets, GCP, Terraform
